Database Programming with SQL
14-1: Intro to Constraints; NOT NULL and UNIQUE Constraints Practice Activities

Objectives

- Define the term "constraint" as it relates to data integrity
- State when it is possible to define a constraint at the column level, and when it is possible at the table level
- State why it is important to give meaningful names to constraints
- State which data integrity rules are enforced by NOT NULL and UNIQUE constraints
- Write a CREATE TABLE statement which includes NOT NULL and UNIQUE constraints at the table and column levels
- Explain how constraints are created at the time of table creation

Vocabulary

Identify the vocabulary word for each definition below.

	Every value in a column or set of columns (a composite key) must be unique
	For every row entered into the table, there must be a value for that column
	Constraint ensures that the column contains no null values and uniquely identifies each row of the table
	Specifies a condition for a column that must be true for each row of data
	Identifies that table and column in the parent table
	An integrity constraint that requires every value in a column or set of columns be unique
	Designates a column (child table) that establishes a relationship between a primary key in the same table and a different table (parent table)
	References one or more columns and is defined separately from the definitions of the columns in the table
	Database rule.
	Database rule that references a single column

Try It / Solve It

Global Fast Foods has been very successful this past year and has opened several new stores. They need to add a table to their database to store information about each of their store's locations. The owners want to make sure that all entries have an identification number, date opened, address, and city and that no other entry in the table can have the same email address. Based on this information, answer the following questions about the global_locations table. Use the table for your answers.

Global Fast Foods global_locations Table						
NAME	TYPE	LENGTH	PRECISION	SCALE	NULLABLE	DEFAULT
Id						
name						
date_opened						
address						
city						
zip/postal code						
phone						
email						
manager_id						
Emergency contact						

1. What is a "constraint" as it relates to data integrity?

2. What are the limitations of constraints that may be applied at the column level and at the table level?

3. Why is it important to give meaningful names to constraints?

4. Based on the information provided by the owners, choose a datatype for each column. Indicate the length, precision, and scale for each NUMBER datatype.

5. Use "nullable" to indicate those columns that can have null values.

6. Write the CREATE TABLE statement for the Global Fast Foods locations table to define the constraints at the column level.

7. Execute the CREATE TABLE statement in Oracle Application Express.

8. Execute a DESCRIBE command to view the Table Summary information.

9. Rewrite the CREATE TABLE statement for the Global Fast Foods locations table to define

the UNIQUE constraints at the table level. Do not execute this statement.
